common scenario experienced by publincs titRuetpioobmytsPPOA Kenya are attributed to supplier's perforimsasnucees.

In supply chain management, vendor-customer relationships are critical to the success of the strategic profits of the business and in order for a vendor to keep track of his profit. A supplier-customer relationship is complex for manufactures involving in both learning and innovation to jointly create value, but also self-interest bargaining to claim value being created by vendors (Ghosh & John, 1999; Subramani, 2004). Due to the fact that global competition has increased vendors' interest in using market mechanism to attract profits, and that buyer-supplier relationships are often asymmetric with the power dependence position favoring the large industrial customer, there is a reason to be concerned for the profitability and survival of smaller suppliers (Gomes-Casseres, 1997; Forrest, 1990). However, inefficiencies still exist ranging from supplies being made halfway or even termination of contracts before conclusion from the manufactures side and lack of brand loyalty from the customers' point of view.

Thus, is against this backdrop that this study is been carried out to evaluate the vendors relationship with his suppliers and

LITERATURE

Theoretical Review

Previous study has illustrated various theories used to explain the relationship between buyer-supplier relationships on procurement performance such as resourcebased view theory (RBV), social exchange, and transaction cost theory among others. This study is anchored on the social exchange theory. Based on the social exchange theory a business network may be seen as a type of exchange network (Blakenburg&Johanson, 1992), and can be defined as a set of interconnected exchange relationships (Prenkert&Hallen, 2006). This is directly linked to supply relationships, and underlines the importance of the supply network within the business network context. An alternative approach to the social exchange theory perspective is the market exchange theory perspective (Easton & Araujo, 1994), which builds on the concept of organized behavioral systems also reinterpreted by Bagozzi (1974). Alajoutsijarvi, Tikkanen (2001) even point out the perspective of networks as business systems, where the business network is understood as an organized behavioral system of exchange.

Eriksson, (2001) argues that the main focus of such a system is on the transformation and exchanges of resources, and less on the social exchange component. It is from this perspective that buyersupplier networks sometimes referred to as supply networks are most frequently analyzed. These relationships are however usually embedded in various networks of interconnected buyer-supplier relationships, where both market exchange transformation and exchange of resources, as well social exchange perspectives trust, collaboration, etc. should play equal parts. However, despite this, there still exists a gap in the existing literature in appropriately balancing both of these perspectives in the study of buyer-supplier relationships. Thus, while the marketing literature has so far focused mainly on the impact of trust and commitment on satisfaction and loyalty, supply chain management has focused narrowly on the hard determinants of flexibility, like i.e. information optimization and inventory management Claro (2004) also emphasizes how business networks, supply chains networks and buyer-supplier relationships are all types of business relationships raging from a web of connections to a dyadic relationship with often blurred boundaries.

Communication and Procurement Performance

Effective communication is a critical component of buyer-supplier relationships. Procurement professionals utilize a variety of media to communicate with sup-pliers, including phone, fax, face-to-face, mail, email, Internet, and electronic data interchange (EDI) thus improving procurement performance.(Rodrigo, 2001) Goodman, (2001) define communication as the formal as well as informal sharing of meaningful and timely information between firms. Cannon and Perreault (1999) suggest more open sharing of information is indicated by the willingness of both parties to share important information.

Cooperation and Procurement Performance

Cooperative Procurement is a term that refers to the combining of requirements of two or more public procurement entities to leverage the benefits of volume purchases, delivery and supply chain advantages, best practices, and the reduction of administrative time and expenses thus improving procurement performance. (Benton, 2000) According to Maloni, (2000) the power of a supplier over a retailer is increased by the level of retailer's

cooperation the supplier. Cooperation results from the need to maintain the channel relationship to achieve desired goals and reflects the essentiality and replace-ability of the goods and services provided by the supplier thus successful outcomes of procurement actions.
